

Anaconda

SENIOR SOFTWARE ENGINEER
NOV 2024 — AUG 2026

Brought on to work on the AI Assistant in JupyterLab. Within the first few months, shipped a single button that got as much use as the AI Assistant itself - the fix code button. Also worked on a variety of less impactful things like helping with domain migration for the AI Assistant, and building a next-gen agentic Jupyter Notebook competitor. This is some of the most technically demanding work I've done. We used a peer-to-peer local-first sync engine that is under active development.

TYPESCRIPT: REACT, VITE, TRPC, SHADCN/UI • BACKEND: PYTHON, CLOUDFLARE, KUBERNETES

Umbrel

LEAD FRONT-END ENGINEER
OCT 2023 — MAY 2024

They brought me on for their biggest software release. This was going to be a 1.0 release, and a total rewrite of the existing codebase. The stakes were even higher because this was software that could not be patched as easily as a web page because the code runs locally on a user's machine. It was their biggest and most successful release. I was responsible for the entire frontend codebase.

TYPESCRIPT: REACT, RADIX UI, FRAMER MOTION, I18NEXT, TRPC, REACT ROUTER, VITE • CSS: TAILWIND

Contracting + side projects

FULL STACK ENGINEER
APR 2019 — NOV 2024

Worked at a VC-funded stealth startup that shut down. Also worked on some personal projects I worked on included a web browser with tree-style tabs, a typing test app, a crypto notary app, and a Chrome extension.

TYPESCRIPT: REACT, VITE, SHADCN/UI, TRPC, NEXT.JS • CSS: TAILWIND • BACKEND: NODE.JS, PRISMA

TrustToken

SENIOR UI ENGINEER
MAY 2019 — NOV 2019

Worked on was an internal KYC app to prevent terrorists from buying crypto from us. We had \$200 million in market cap at the time. Our team had a difficult time keeping up with all the inbound. Before my work, our KYC team had to wade through nearly static web pages. Each page was almost a raw table dump, with maybe a couple action buttons. Information was disjointed and required lots of clicking and scrolling. This was highly cross collaborative with the KYC team. Also worked on maintenance of existing code customer portal, built a transaction interface, and a complex sign up form for arbitrarily nested organizations.

TYPESCRIPT: REACT • CSS: STYLED-COMPONENTS, TACHYONS • NODE.JS

Thumbtack

UI ENGINEER
AUG 2017 — NOV 2018

Immediately after joining, I was tasked with rebuilding the front door to Thumbtack (a \$1b company at the time) from Angular to React. The company was growing quickly. We had over 100 engineers. I interviewed dozens of candidates as the company grew. Also worked on a booking coordination feature inside the messaging app, and in-app notifications.

JAVASCRIPT: REACT • CSS: STYLED-COMPONENTS • PHP

Zetta

LEAD UI ENGINEER
MAR 2015 — APR 2017

We had an 8yo codebase that was nearly impossible to work in as a result of old technologies, and a couple abandoned refactors. By the end of my time, only the file browser was the only remnant of the old interface. This was a roughly 50 person company with about 5 engineers. Wrote the frontend and an interface for our new Disaster Recovery product, white labeling, and internationalization. Led frontend decisions, cleaned up over 100,000 lines of code. Interviewed candidates. Self-initiated collaboration with support team, sales, and customer UX sessions.

JAVASCRIPT: REACT • CSS: SASS • PHP • ELECTRON

EDUCATION

UC Davis, B.A. in Computer Science (unfinished)

*My legal last name includes the grayed out part, but I almost always leave it off for online accounts.
